

Dragon Vault API Documentation

1. Internal Fund Transfer

Endpoint: POST /transfer/fund-transfer.php

Description

Transfers funds between accounts within Dragon Vault bank system. Requires user authentication and OTP verification.

Authentication

- Requires valid user session with account_holder_id
- Source account is automatically retrieved from the authenticated user's session

Request Parameters

Parameter	Type	Required	Description
recipient_account_no	string	Yes	Recipient's account number
transaction_amount	float	Yes	Amount to transfer
transaction_type	string	No	Defaults to 'Internal transfer'
recipient_bank_code	string	No	Automatically set to 'Dragon Vault' for internal transfers

Session Data

Field	Type	Description
account_holder_id	string	Automatically retrieved from user's session
account_number	string	Source account number retrieved from user's session

Response

Success Response (200 OK)

json

```
{
  "success": true,
  "message": "OTP has been sent to your registered mobile number",
  "transaction_id": "123"
}
```

Error Response (400 Bad Request)

json

```
{
  "success": false,
  "error": "Missing required fields"
}
```

Business Logic Flow

1. Validates user session and required fields
2. Retrieves source account details from session:
 - Gets account_holder_id from session
 - Fetches associated account_number and balance
3. Checks source account existence and balance
4. Verifies recipient account existence

5. Generates OTP and creates pending transaction
6. Stores OTP in database with 5-minute expiration
7. Sends OTP to user's registered phone number
8. Returns transaction ID for OTP verification

2. External Fund Transfer

Endpoint: POST /transfer/fund-transfer-external.php

Description

Initiates a transfer to an external bank account. Requires user authentication and OTP verification.

Authentication

- Requires valid user session with account_holder_id
- Source account is automatically retrieved from the authenticated user's session

Request Parameters

Parameter	Type	Required	Description
recipient_account_no	string	Yes	Recipient's account number at external bank
transaction_amount	float	Yes	Amount to transfer
recipient_bank_code	string	Yes	Code of the external bank (e.g., 'Blinders Vault', 'StackOverCash')

Session Data

Field	Type	Description
account_holder_id	string	Automatically retrieved from user's session
account_number	string	Source account number retrieved from user's session

Response

Success Response (200 OK)

json

```
{
  "success": true,
  "message": "OTP has been sent to your registered mobile number for external transfer",
  "transaction_id": "123"
}
```

Error Response (400 Bad Request)

json

```
{
  "success": false,
  "error": "Invalid recipient bank code"
}
```

Business Logic Flow

1. Validates user session and required fields
2. Retrieves source account details from session:
 - Gets account_holder_id from session
 - Fetches associated account_number and balance
3. Verifies recipient bank code against allowed external banks
4. Checks source account existence and balance

5. Generates OTP and creates pending transaction
6. Stores OTP in database with 5-minute expiration
7. Sends OTP to user's registered phone number
8. Returns transaction ID for OTP verification

3. Receive External Transfer

Endpoint: POST /transfer/receive-external.php

Description

Receives incoming transfers from external banks. This endpoint is called by external banking systems.

Authentication

- No user session required
- Validates source bank code against allowed external banks

Request Parameters

Parameter	Type	Required	Description
transaction_amount	float	Yes	Amount being transferred
source_account_no	string	Yes	Sender's account number at external bank
source_bank_code	string	Yes	Code of the sending bank
recipient_account_no	string	Yes	Recipient's account number in Dragon Vault

Response

Success Response (200 OK)

json

```
{
  "fund_transfer_success": true,
  "transaction_id": "123"
}
```

Error Response (400 Bad Request)

json

```
{
  "fund_transfer_success": false,
  "error": "Recipient account not found in Dragon Vault"
}
```

Business Logic Flow

1. Validates required fields and source bank code
2. Verifies recipient account existence in Dragon Vault
3. Updates recipient's account balance
4. Records the incoming transaction
5. Returns transaction ID

Security Notes

- This endpoint should be secured with appropriate API authentication
- External banks should be whitelisted
- All transactions are logged for audit purposes
- Uses database transactions to ensure data consistency
